

Protect Your Concrete.

Concrete surfaces, such as driveways, sidewalks and patios need to be protected from the harsh elements, including winter weather. Most homeowners never protect their concrete. If they do, they use a topical sealer one time only. But, topical sealers only protect the top surface of the concrete, and many products require annual re-application.

Protect all of the Concrete, Not just the Surface!

De-icing chemicals can be harmful to the bonds within concrete. These chemicals dissolve in water and often end up penetrating concrete's top, sides, and bottom. Once inside, they crystallize and accumulate over time.

Slowing the deterioration process.

Manually cleaning concrete and applying a sealer after concrete has been placed, protects the top. But concrete is like a hard sponge that absorbs water from all directions (top, bottom, and sides of a slab).

Also, film forming sealers require ambient temperatures above 50°F, which creates a problem for late-season concrete. These issues, in combination with ever-increasing labor costs, means the vast majority of concrete goes unprotected.

De-icing salts often cling to the underside of vehicles and end up deposited in driveways. Over time these salts can wreak havoc on unprotected concrete!

The solution: Impede® IntraSeal is a water-repelling admixture that can be added to concrete during the batching process at the ready-mix plant.

Today, you can order concrete that repels water from the inside-out. Eliminate the time, labor, and added costs associated with applying sealers.

The best part... **Impede® IntraSeal** is not water based, and will not freeze! That means it can be included in concrete year-round, solving the decades-old problem of protecting late-season concrete!

Impede® IntraSeal is a stand-alone product that conforms to ASTM C494 Type S specifications. It is compatible with most other admixtures, so there's no need to change admixture suppliers.

Market-leading Advantages:

- High water repellency
- 3 year guaranteed shelf life
- Simple 6oz / cwt dosage
- Cold-weather approved
